What your app does:

The app takes two strings and matches them against each other with a chosen similarity matrix

To enter gaps in the middle of a string, use the – (dash, or minus)

How to run it:

To run the app, simply launch it from the home screen

Any features you feel are of particular note:

The app also checks for incorrect letters (nonexistent in the matrix) for safety

It also stops you from pulling the strings further than complete a non-overlap.
